

Editorial

We present the second issue of this volume with the following research.

Cloud has much impact in the recent computing technology as it penetrates several sub-domains. Realizing this value the authors *Ritu Singhal, Archana Singhal and Sonia* in their paper on “**Towards a generic E-Cloud Architecture for Universities**” have proposed a generic cloud architecture for higher education and highlighted the various hardware and software issues including cost. They also suggested to make it scalable for specific purposes.

In the next paper on “**Structural features of the models in Project Management**” the authors have used the organized as well as regularized features and enhanced models in the Project Management. They used several successful project models.

In the next paper on “**Effect of Icon Concreteness, Semantic Distance and Familiarity on recognition level of mobile phone icons among E-literate and Non E-literates**” the authors measured the recognition level of icons among e-literate and non-e-literate people. The authors in the study concluded that designers of mobile phone icons have to balance a trade-off between the need, requirements and understanding of both e-literate and non e-literate users.

The papers published in this issue are valuable addition to the stock of knowledge.
