

Editorial

We publish the second issue of the twelfth volume of Journal of Electronic Systems with the below-listed papers.

In the first paper on “**Signal processing with wavelets using Fourier analysis**” the Fourier analysis is used for organizing and processing signals. We have studied the necessary data with the ability to compress and allowed the testing. The authors further compressed, filtered and processed the necessary information.

In the next paper on “**Radiation pattern in antenna reflectors with QUAD antenna**” the authors have performed the radiation pattern with 2biQUAD antenna. Radio networks are likely to use the radio coverage applications with the measurements using the system the authors have used.

In the last paper on “**Energy efficiency analysis using optical switch and splitters for smart sensors charging**”, the authors also performed energy efficiency analysis for photon energy charge. and compared it with similar methods. Finally, the authors have documented the system with optical splitter which is technically easier for construction and maintenance and also lesser than other systems.

We do hope to bring more research in the next few issues.
