Editorial

We now present the last issue of the ninth volume of the Journal of E-Technology with the research on new innovative themes.

In the opening paper on “Motivators and Barriers of Chatbot Usage in Recruiting: An Empirical Study on the Job Candidates’ Perspective in Germany” the authors Linda Schildknecht, Judith Eißer, Stephan Böhm have improved efficiency in digital recruiting for which chatbots offer more promise. First the authors have studied the motivators and barriers of recruiting chatbot usage. Next they studied the factors influencing the perception of recruiting chatbots derived from the theory of social presence. Using surveys the motivators, barriers, and design preferences from the candidate perspective of the chatbots are experimented.

Lasse Berntzen in the paper on “The “Consultative” Methodology and Technology Support for Consultations” studied the e-Consultations in the ICT. The author has introduced the methodology for consultations between stakeholders (“Consultative”) and discussed how this methodology can be supported by ICT. The discussion is based on a bilateral project between Poland and Norway to implement the “Consultative” methodology in Poland.

Corina Holom and Delilah Florea in their last paper on “Medplanner: Android Application for Reminding Users About Medication” presented the dependence of technology by large number of people. They presented the MedPlanner, an application that aims to ease users’ lives by clearing off a common concern, and forgetfulness. They viewed that this application is useful to all the categories of users.

The papers presented in this issue characterize the unique features of the research reported.
