ABSTRACT: Nowadays, knowledge management is considering an essential part of organizations to use the expertise, and bright ideas to prepare and equip itself with a vision to foresee the future. The knowledge management has started to be the main entry to the governments. Many reasons for this development (i.e. emergence of information and communication technologies in the last decade, the emergence of knowledge worker, and the knowledge economy).

Keywords: E-government, Knowledge management, Jordan, MOICT

1. Introduction

The world today is witnessing a massive wave of change multifaceted and objectives. The process of change and transition towards a knowledge society is a social process rather than economic, associated with the process of economic transition, industrial transition, and the emergence of knowledge-based economics. This transformation process concluded to a global-wide change, such as the emergence of the phenomenon of globalization, the collapse of trade barriers and borders, and so on. In light of these changes and developments, all institutions seeking to sustain their work, and survival in this changing world. This can not be achieved unless the institution has a competitive advantage by enabling to survive. The acquisition of correct knowledge related to the work of the organization and management of such knowledge is the key factor in achieving competitive advantage. Knowledge is the only resource that can not be copied and it has a great value, unlike the traditional factors of production which became in secondary rank in the production process, and can be copied.

The old truism ‘knowledge is power’ has never been more true than it is today; knowledge is new currency of power [29]. Knowledge management including collecting updated right data and it provides the right information and capability of fast safe information delivery [20].

Jordan is part of this world. Jordanian institutions whether governmental or private suffer today, from the pressures of global competition created by the wave of globalization in terms of liberalizing the movement of global trade, the removal of border barriers to the movement of goods, services, and capital between the different countries of the world. For example, the Jordanian government institutions suffer intense competition governmental institutions in the region in attracting foreign investments, which is required providing the best services to the Jordanian citizens and foreign investors alike.

The same applies to the private sector producing goods and services are also exposed to other more types of competition in the domestic and global markets. This requires that the institutions of government and private sector institutions to become competitive, where these institutions will not reach this stage only if the knowledge-based institutions through the application

of knowledge management properly. No one can ignore the importance of knowledge which is an essential resource of the government and the performance of government rests significantly on the acquisition and use of resources [1].

The management of knowledge is of increasing importance to governments in their effort to deal with the growing challenges created by the knowledge economy.

This paper is organized as follows: in section 2, defining e-government concept and explaining its importance. In section 3, defining knowledge management concept and explaining its importance. In section 4, answering the question if there is relationship between e-government and knowledge management by introducing the reality of implementing knowledge management in Jordanian institutions with some problems. Finally the conclusion is drawn in section 5.

2. Conceptual framework of E-government

For any who one wants to understand the idea of E-government, must first understand government in general. Government is actually a dynamic mixture of objectives, structures and functions [2]. E-government is not governance per se, the essence of the concept is the “E”, and that is, utilizing electronic E-government is more than a website, email or processing transactions via the internet. E-government becomes a natural extension of the technological revolution that has accompanied the knowledge society. The E-government added new concepts such as: transparency, citizen participation in the evaluation of government performance [4].

World Bank website provided definition of e-government as: “...the use by government agencies of information technologies... that have the ability to transform relations with citizens, businesses, and other arms of government. These technologies can serve a variety of different ends: better delivery of government services to citizens, improved interactions with business and industry, citizen empowerment through access to information, or more efficient government management. The resulting benefits can be less corruption, increased transparency, greater convenience, revenue growth, and/or cost reductions...”[5].

According to the Institute for development Policy and Management [6], “e-government is the use of information and communication technologies (ICTs) to improve the activities of public sector organizations” and it covers: “Improving government processes: by bringing e-administration, making strategic connections in government, connecting citizens, building external interactions through e-society having good relationship between public agencies and other institutions”. E-government can provide many benefits on the countries if they apply it correctly, it will make the government more transparent, efficient, and enable government information and services to be delivered to citizens in fast and easy manner with cost reduction [7]. The citizen does not need to go to different government offices when a mouse click at his/her home or other locations will do the same work in minutes [8].

Heeks [9] further explains that e-government providing 3 main benefits:

- 1) Improving government process / e-administration: by making processes time and cost effective, managing process performance, making strategic connections in government, and creating empowerment.
- 2) Connecting citizens: by providing citizens with public sector activities in details, increasing citizen input into government decisions and actions and improving public services.
- 3) Building external interactions: by creating an e-society that involves improved relationships between public agencies and other public and private companies, interaction between government and business. E-government requires internet-based technologies to provide facilitated access to government information and services, and citizens and enterprises engagement through e-government portals as a collective vision of all government activities.

In Jordan, E-Government Program is a national initiative of his Majesty King Abdullah II, the mission is to manage change in the government and focus on the satisfaction of the recipients of government service, and achieving this through various channels to deliver the service using modern technology, knowledge management, recruitment experienced and qualified staff to implement e-government program and initiatives to be easy and acceptable to citizens in Jordan. The e-government program contributes effectively to develop and administrate transformation of the government of Jordan.

To achieve this mission, e-government program depends on the application of the following themes:

- Applications related to electronic services.
- Define and develop appropriate technological infrastructure.
- Define and develop the structure of adequate legislative and regulatory environment.
- Effective Process re-engineering to achieve high efficiency.
- Transformation and development in the field of education, training and knowledge transfer.
- Change management and restructuring of government institutions

To achieve this, been assigned to Ministry of Communications and Information Technology (MOICT) working on the preparation of e-government strategy in coordination with various stakeholders. UN conducted a study [10] in 2008 presents a comparative assessment of 192 United Nations Member States'. According to this study, the provision of services has seen by government agencies significant development more than just being a traditional model of the government that provide services to citizens in traditional ways to focus heavily on E-government services to become one of the vital components that increase the value of services to citizens and then many countries in different regions of the world is reviewing strategies of developing public sector to ensure increased value of the services provided to the public through the electronic network and develop. The study showed readiness for e-government that there is considerable variation between the five continents of the question of readiness for E-government For example, the Americas got 0.4936 points, Europe got 0.6490 points, , Oceania by 0.4338 points, Asia 0.4470 points, and Africa is estimated at 0.2739 points. It should also be noted that Arab countries improved significantly since the 2005 survey, where Jordan moving up 18 positions as shown in Figure 1. The reasons of this improvement understand the society for the importance of E-government, websites and services.

Figure 1. E-government Readiness (2005 and 2008 Rankings)

3. Significance of Knowledge Management

Knowledge Management (KM) has been defined differently by different authors. Prior studies defining knowledge management are shown in Table 1.

For the purpose of this paper Misra's [19] approach is adopted, who defines Knowledge management for government as "leveraging Knowledge for improving internal processes, for formulation of sound government policies and programs and for efficient public service delivery for increased productivity". This definition fits best in the context of this paper, because it is for the government and it is an inclusive definition.

Author	Definition of knowledge management
Quintas et al. (1997)	Knowledge management is to discover, develop, utilize, deliver, and absorb knowledge inside and outside the organization through an appropriate management process to meet current and future needs [11].
Allee (1997) Davenport (1998) Alavi and Leidner(2001)	Knowledge management is managing the corporation's knowledge through a systematically and organizationally specified process for acquiring, organizing, sustaining, applying sharing and renewing both the tacit and explicit knowledge of employees to enhance organizational performance and create value [12,13,14]
Gupta et al. (2000)	Knowledge management is a process that helps organizations find, select, organize, disseminate, and transfer important information and expertise necessary for activities [15]
Bhatt(2001)	Knowledge management is a process of knowledge creation, validation, presentation, distribution and application [16]
Holm(2001)	Knowledge management is getting the right information to the right people at the right time, helping people create knowledge and sharing and acting on information [17]
Horwitch and Armacost(2002)	Knowledge management is the creation, extraction, transformation and storage of the correct knowledge and information in order to design better policy, modify action and deliver results [18]

Table 1. Knowledge management definitions

The essence of knowledge management (KM) is to provide strategies to get the right knowledge to the right people at the right time and in the right format [26] in different applications as shown in Table 2. Zhou & Gao [30] have identified three benefits of knowledge management in e-government as being conducive to enhance governments' competence, to raise governments' service quality, and, to promote healthy development of e-government.

King Abdullah II Award for Excellence for the public and private sectors came to be the main driver for improving the performance of the Jordanian institutions of government and private, particularly adopted knowledge management as one of the main criteria for this award.

4. Applications derived from Knowledge Management for E Governance

Nowadays all governments have either built or are building their own e-government systems to provide better service for the citizens and at the same time to increase government efficiency. Similar to organizations in the private sector, which tend to regard knowledge management as simply building a corporate intranet or other IT systems, government people tend to regard e-government as the synonym of knowledge management. I would like to point out that these are two different concepts, the former emphasizing on the operation side while the latter emphasizing on the management side. It should also be noted that the proliferation and popularity of e-government has laid out a solid foundation for the governments to start their own knowledge management programs and to enjoy the benefits from these programs [3].

Misra [19] defines knowledge management for e-government (KM4EG) as "management of knowledge for and by e-government for increased productivity. KM4EG is a management tool for government decision makers and its program implementers", and introduced 10 guiding principles for introduction of knowledge management in e-government shown in Table 3.

One of the main factors for the success of E-government requirements is the availability, accessibility, and applicability of appropriate governmental organization knowledge within e-government systems [21]. Executives in government organizations

increasingly recognize that in order to maintain or gain government competitive advantage, governmental knowledge needs to be managed and integrated into their e-government systems [22-24].

Industry	Reasons to adopt knowledge management
Business Services	Retain Expertise, Increase Customer Retention
Communications	Retain Expertise, Improve Profits
Government	Retain Expertise, Increase Customer Retention
Education	Retain Expertise, Increase Customer Retention
Financial Services	Retain Expertise, Improve Profits
Discrete Manufacturing	Increase Customer Retention, Improve Profits
Other Process Manufacturing	Retain Expertise, Improve Profits
Healthcare Services/ Pharmaceuticals	Retain Expertise, Increase Customer Retention
Insurance	Increase Customer Retention, Improve Profits
Retail/Wholesale	Retain Expertise, Increase Customer Retention
Transportation	Retain Expertise, Increase Customer Retention
Utilities/Energy/ Chemicals	Retain Expertise, Improve Profits

Table 2. Reasons to adopt knowledge management

Knowledge management basing on the e-government environment is a new management concept, which has the potential to improve the provision of electronic services [25]. In the field of electronic service delivery, the knowledge management tools can add a lot of effectiveness on service explaining, how to search for, access to, and can be characterize the service as follows:

1. Find out why: Information on the nature of service, usefulness and purpose
2. Find out Whom: who will provide the service and who will get benefit?
3. Find out when: the date of service and the time required to obtain the result
4. Find out how: actions (procedures) related to the service
5. Find out where: site providing the service and receive the result
6. Find out what: the required documents and fees on the service.

Jain [28] introduced some recommendations to build a successful e-government:

E-government should not be limited to a project level, but should be seen a comprehensive government wide ongoing process.

- There is a need of change management; individual change of mind-set and governmental change to keep pace with the global changes to gain and sustain a competitive edge;
- There should be strong collaboration at local, regional and national levels and between public and private sector organizations;
- Knowledge management portals should be based on citizen empowerment and interaction and they should provide multi-channels delivery of public services to cater for all levels of citizens and stakeholders.

- There is a need of decision support systems for designing new services tailored to citizen needs and suitable for complex E-government scenario [31].

Guiding Principle	Explain
1)	Develop a knowledge management strategy for the organization Leverage knowledge for achieving organizational goals and serving citizens and non-citizens.
2)	Proceed step-wise, from simple to the complicated. Adopt modular approach. Do not attempt anything highly ambitious in the initial stages.
3)	Do not re-invent wheel. Make use of existing knowledge and insights. Undertake knowledge needs assessment. Only then plan the next step.
4)	Make use of information and communication technologies (ICTs). But do not forget GIGO, garbage in, and garbage out.
5)	Make use of people, process and technology (PPT) model. But do not forget: Computers: fast, accurate, dumb, People: slow, sloppy, smart
6)	Prepare a simple and modular knowledge sub-plan incorporating knowledge management strategy. Do not use any complicated knowledge management tool or mechanism that cannot be successfully implemented.
7)	Include knowledge management sub-plan in the e-business plan of Ministry/Department. Do not prepare any stand-alone knowledge management sub-plan. It is more likely to fail than succeed.
8)	Secure top management support to knowledge management sub-plan. Remember, no plan can succeed without top management buy-in. This is to be a priority.
9)	Demonstrate results. Remember, the best way to convince any one about practical utility of knowledge Management is to show concrete, verifiable results.
10)	Review the implementation of knowledge management sub plan from time to time

Table 3. Guiding principles for introduction of knowledge management in e-government

4.1 The Reality of Implementing Knowledge Management in Jordanian Institutions

Fortunately, the government and private institutions of Jordan began looking forward to be a knowledge-based institutions, especially since the award's King Abdullah II Award for Excellence have adopted knowledge management as one of the standards of excellence. On this basis, the Jordanian institutions started both governmental and private in applying of knowledge management initiatives. But we have to say frankly that these attempts are still in their infancy and they are far in their application to a large extent on the correct understanding and true knowledge management. For example, there is still considerable confusion between the concept of information and the concept of knowledge, confusion between the concept of technology management and the concept of knowledge management.

Anyone examines the knowledge management applications and contents of knowledge bases that are being built in our institutions generally, will find that the management of knowledge that is applied is not the wanted, and that the knowledge bases that are being built are the rules of data and information and not knowledge bases. A comparative analysis study between governmental institutions of and private sectors used to determine the extent of use of the Jordanian institutions for knowledge management. This study found that the degree of employment of knowledge management in Jordanian institutions in the public and private sectors is relatively limited. This is a clear indication of the vulnerability of the application of knowledge management in Jordanian institutions.

B. Problems of Implementing Knowledge Management in Jordanian Institutions

A number of problems, some old and some new, have arisen in knowledge management for and by e-government in government, for example [27]:

- Information is not up to date.
- Required information is not available,
- Too much information is collected,
- Very little information is used in actual decision-making,
- There has been information explosion and
- New areas like information and communication technology (ICT) and e-government have emerged calling for collection of new information.

To address knowledge management problem in Jordan, it is necessary to examine the socio-cultural factors that affect on the development of knowledge management process in Jordanian organizations. Many of empirical researches on Arab management indicate that organizations in these countries face many organizational and managerial problems, stemming from their bureaucratic design and prevailing power culture. Many scholars [32-37] denoted that Arab management practices are mix of different characteristics: hierarchical authority, rules and regulations contingent on personality and power of individuals who make them, subordination of efficiency to personal relations and connections, indecisiveness in decision making, informality among lower level managers, a generally patriarchal approach and nepotism. Original thinking and creativity are condemned, and submissiveness and obedience are rewarded.

There are many reasons that hinder the application of knowledge management in Jordanian government and private institutions, notably: Lack of awareness of the fact that knowledge management is not management of information and management of technology held by the institution, but rather a management philosophy aimed at making the organization smarter and response to emergency situations and the changing environment. The knowledge management is used to make strategic long-term improvements, because of the lack of awareness of this fact there is no suitable support from senior management for the application of knowledge management, and as a consequence no allocation the necessary financial resources for the application of knowledge management, including correct training in the implementation. Here I would like to draw attention to the world attention for using knowledge management, as statistics indicate that investment in the field of knowledge management is a successful investment worth 12.7 billion U.S. dollars in 2005.

There are several steps that can be done in order to become the Jordanian institutions of knowledge-based enterprises, including:

- 1) Establishment of a governmental body dealing with matters of knowledge management, its job is public policy-making related to knowledge management initiatives launched in various public departments, implementation, and monitoring. Added to this, the body should providing advice and expertise to private sector.
- 2) Adding course in Jordanian universities enables students to understand the concept of knowledge management, benefits, objectives and operations, thereby enhancing their contribution in the implementation of knowledge management initiatives when they enter the labor market.
- 3) The organizations should involve their staff in training courses to enable them to understand the content of knowledge management.
- 4) Modifying the rewards and compensation systems to encourage the generating, transferring, sharing, and utilizing knowledge.
- 5) The need for concerned official bodies to encourage institutions, public and private - facilitating knowledge transfer and sharing, by opening channels joint work between the public and private sectors with a view to strengthening relationships and partnerships between them, it would enhance the generation, transfer and sharing of knowledge.
- 6) Publishing the results of the implementation of knowledge management initiatives in some public and private institutions, in order to broaden and strengthen the awareness of other institutions of the benefits of knowledge management, so that these results become educated lessons and targets to follow.

5. Conclusion

This paper gives insight into the issues of knowledge management in e-government in general with a special emphasis on Jordan. It specifically investigated that the success of e-government depends on knowledge management. Knowledge management provides the overall strategy and techniques to manage e-government content eloquently in order to make knowledge more usable and accessible and to keep it updated, though better and more accurate understanding of knowledge management as an enabler for e-government is needed.
