Editorial

We bring the last issue of this volume of the **Journal of E-Technology**.

In the first paper on "**A study of the VoIP services with the integrated telephones' features**", the authors addressed the VoIP services with the integrated telephones with the emphasis on the features and ability. The authors have observed that the key QoS parameters defined for the conversation speech were reasonable. The test results confirm the successful integration of analog telephones into the VoIP service.

In the second paper on "**Models, Methods and material base of the elearning process**", the authors used the models, method, tasks, the material base and the problems in the teaching process using the digital phase locked loop. Varied phase locked loops are built and tested which conclude the performance of the circuits for Digitally Controlled Oscillators.

In the last paper on "**Simulation and analysis of edge coupled microstrip filters**", the authors presented simulation and analysis of edge coupled microstrip filter. They simulated the five pole filter that helped for the production and measurements. They found that the correlation between simulation and obtained results are very strong.

The papers of this issue are technically contribute to the E Technology Research.
